

My mind explodes with knowledge when new technologies enter my school. There are two specific kinds that I use in my classroom and that I really like. These two technologies are the Promethean board and the document camera.

The Promethean board made it easy for my brain to learn new and remember old things. Such as, in math class, we were reviewing addition and subtraction on the Promethean. This is much more fun than writing it on paper. It has also taught me techniques for handwriting. For example, my class and I practice writing in cursive on the Promethean board. This technology also makes learning fun and exciting by getting to be the teacher in front of the whole class when we are doing our DLI's on the Promethean board. I interact with my friends when using the Promethean too. One example is that we are able to correct each other's mistakes.

Document cameras are also a new technology that helps my classmates and me. My teacher will give us "mini lessons" if we are struggling in a subject. The document camera will also let our teachers be able to use our worksheet instead of writing the questions on the white board. The document camera is also very helpful with new lessons and subjects. For example, we use the document camera with our new lessons in math with our multiplication and division. It makes it a lot more fun to learn new things.

These two new technologies have increased my learning by making it more exciting. Learning is a lot more fun now. I am sure the Promethean board and document cameras will continue to expand my knowledge.
